**KĀPĒC PERFECT EYES?**

Šī ar karotinoīdiem bagātā formula ir balstīta uz 2001. un 2006. gada AREDS pētījumu rezultātiem. Pirmajā pētījumā tika atklāts, ka C un E vitamīnu, beta-karotīna, cinka un vara maisījums palīdzēja piecu gadu laikā samazināt ar vecumu saistītas makulas deģenerācijas (VMD) progresēšanas risku par 25%. Otrajā pētījumā luteīns, zeaksantīns un omega-3 taukskābes tika pievienotas maisījumam, lai iegūtu papildu priekšrocības. Mūsu Indijas partneris, kas piegādā luteīnu, apgādā vietējos lauksaimniekus ar ĢMO nesaturošām sēklām un ir pilnībā apņēmies nodrošināt ilgtspējību. Arī sadarbojas ar Shankara Eyecare Institute of India, piedāvājot bezmaksas acu pārbaudes, nodrošinot brilles un palīdzot iedzīvotājiem ar kataraktu, kas ir izplatīts akluma cēlonis Indijā.

## STĀSTS AIZ PERFECT EYES

Beta-karotīns būtībā ir dzeltens vai oranžs pigments, kas daudziem dārzeņiem, augļiem, ziediem un citiem augiem piešķir krāsu. Pirmo reizi tas tika kristalizēts no burkānu saknēm 1831. gadā. Beta-karotīns nozīmē "burkāns B" no grieķu valodas beta un latīņu carota. 1851. gadā Hermanis fon Helmholcs izgudroja oftalmoskopu, pateicoties kuram tika atklāta redzes nerva fovea cilvēka acs ābolā. Šajā makulas zonā ir cieši iesaiņotas konusveida šūnas, un tā ir atbildīga par asu redzi, kas nepieciešama ikdienas darbībām, piemēram, sejas atpazīšanai un lasīšanai. Tikai 1988. gadā pētnieki identificēja luteīnu, zeaksantīnu un mezo-zeaksantīnu kā galvenās makulas sastāvdaļas. Šis laukums ir dzeltens, jo tajā tiek glabāti pigmenti, kas uzsūkušies no krāsainās pārtikas. Mellenes tradicionāli tiek izmantotas gremošanas procesa atvieglošanai un iekšķīgai lietošanai. Augs nāk no Ziemeļeiropas. Otrā pasaules kara laikā Lielbritānijas gaisa spēku piloti pirms pacelšanās lietoja melleņu ievārījumu, lai labāk redzētu naktī.
